北大外语类保送备考

英语模拟卷 A

100 分 / 60 分钟 / 模拟卷 A / 2026.10

姓名：_____ 日期：_____ 得分：_____

全卷 50 道单项选择题，每题只有一个正确答案。第 1—20 题每题 2 分；第 21—35 题每题 1 分；第 36—50 题每题 3 分。英文材料为命题原创；文中的城市项目、博物馆史学研究与公司试点为虚构情境，不影射真实研究，无需课外背景知识。

命题依据：用户上传预测样卷的结构与题型；本卷为新编训练材料，不是官方试卷。

I. Vocabulary and Grammar

Questions 1–20. 2 points each, 40 points in total. Suggested time: 12 minutes.

1. No sooner _____ the revised figures than the committee requested another audit.

A. the analyst had presented　B. had the analyst presented　C. the analyst presented　D. did the analyst present

2. The proposal was rejected on the _____ that its projected savings had not been independently verified.

A. foundations　B. premises　C. motives　D. grounds

3. The new documents failed to _____ the two accounts; if anything, they made the contradiction more obvious.

A. reconcile　B. redeem　C. retrieve　D. reassure

4. Such _____ the demand for the specialist course that an additional class had to be arranged.

A. were　B. did　C. was　D. had

5. The validity of her conclusion hinges _____ whether the sample is representative of the wider population.

A. at　B. on　C. with　D. by

6. The audit uncovered a striking _____ between the expenses claimed and the receipts actually submitted.

A. compliance　B. affinity　C. correspondence　D. discrepancy

7. Had it not been for the laboratory assistant, the error _____ unnoticed until the report was published.

A. would remain　B. will have remained　C. would have remained　D. had remained

8. Asked to support or oppose the measure, the spokesperson remained deliberately _____, leaving both interpretations open.

A. equivocal　B. meticulous　C. unanimous　D. categorical

9. It would be misleading to _____ the improvement solely to the new software when staffing levels also increased.

A. subscribe　B. ascribe　C. prescribe　D. transcribe

10. Although attractive in principle, the scheme is _____ with practical difficulties.

A. endowed　B. liable　C. entitled　D. fraught

11. The manuscript, together with the accompanying notes, _____ delivered to the editor yesterday.

A. was B. were C. have been D. are

12. His apology was so _____ that it sounded like a routine duty rather than an expression of regret.

A. peripheral B. prospective C. perfunctory D. provisional

13. At no time _____ the participants told that their individual responses would be made public.

A. had B. did C. was D. were

14. The essay draws a sharp _____ between accepting uncertainty and refusing to investigate.

A. distraction B. distinction C. distortion D. distribution

15. Given the absence of supporting data, the reviewers were understandably _____ of the claim.

A. sceptical B. susceptible C. perceptible D. compatible

16. What matters is not how many objections were raised, but _____ they were examined.

A. that thoroughly B. how thorough C. how thoroughly D. however thorough

17. Long accustomed to reliable supplies, the residents had begun to take clean water for _____.

A. assumed B. confirmed C. conceded D. granted

18. The restriction was imposed under the _____ of protecting consumers, although its actual purpose was to exclude competitors.

A. guise B. image C. shelter D. status

19. It is high time the agency _____ responsibility for checking the information it circulates.

A. takes B. took C. has taken D. will take

20. Until independent teams reproduce the result, the conclusion must remain _____.

A. redundant B. compulsory C. tentative D. irreversible

II. Cloze

Questions 21–35. 1 point each, 15 points in total. Suggested time: 13 minutes.

Measuring Who Benefits

Original passage · hypothetical urban study

When a fictional city planted trees to reduce summer heat, the first official report described the project as an unqualified success. The average temperature recorded by its sensors had fallen. Yet the report soon [21] _____ criticism from residents who said their daily journeys remained as uncomfortable as before.

The disagreement did not necessarily mean that either side was dishonest. Most of the readings [22] _____ conditions in shaded public squares, while many residents spent the hottest part of the day waiting beside roads. The equipment had measured the places that were easiest to monitor [23] _____ the routes on which people were most at risk. A lower [24] _____ therefore concealed substantial differences in experience.

A second team asked volunteers to carry portable sensors during their ordinary journeys. The readings revealed which groups were most [25] _____ to heat. But the researchers also took [26] _____ of information that a thermometer could not supply: whether a bus shelter was accessible, whether a worker could alter a shift, and whether a shaded park required a long detour. Their [27] _____ success in collecting more data did not, by itself, settle how resources should be allocated.

Nor were the volunteers [28] _____ neutral measuring instruments. People willing to join the study had time and confidence that some vulnerable residents lacked. To [29] _____ a genuinely cooler journey from one that simply avoided the hottest hours, the team recorded departure times as well as temperatures. It also recruited through local care groups, reducing the risk of [30] _____ people who rarely attended public meetings.

The final report described benefits as [31] _____ distributed rather than universal. It named the residents for [32] _____ the improvements had been smallest and identified where further planting was needed. It also warned that rising rents might leave long-term tenants [33] _____ from the newly attractive neighbourhoods.

These qualifications made the report less triumphant but more useful. By making its assumptions [34] _____, the team allowed citizens to challenge its priorities. Measurement could inform a public decision; it could not [35] _____ for one. The next debate concerned not whether the city possessed a single favourable number, but whose lives that number described.

21.

A. drew　　B. withheld　　C. resisted　　D. escaped

22.

A. resembled　　B. represented　　C. replaced　　D. restrained

23.

A. as for　　B. in case of　　C. rather than　　D. even if

24.

A. boundary　　B. forecast　　C. maximum　　D. average

25.

A. entitled　　B. exposed　　C. opposed　　D. attached

26.

A. control　B. advantage　C. possession　D. account

27.

A. apparent　B. reluctant　C. irrelevant　D. incapable

28.

A. barely　B. lately　C. merely　D. nearly

29.

A. discharge　B. distinguish　C. discourage　D. disguise

30.

A. overlooking　B. overtaking　C. overturning　D. overstating

31.

A. unanimously　B. accidentally　C. instantly　D. unevenly

32.

A. which　B. whose　C. whom　D. what

33.

A. excluded　B. displaced　C. enclosed　D. released

34.

A. transparent　B. temporary　C. redundant　D. reluctant

35.

A. compensate　B. account　C. prepare　D. substitute

III. Reading Comprehension

Questions 36–50. 3 points each, 45 points in total. Suggested time: 35 minutes.

Passage A

Original passage · historical interpretation

[1] For years, the catalogue of a fictional canal museum told a reassuring story. The opening of the waterway, it explained, had transformed a collection of isolated settlements into a unified commercial community. Anyone able to provide a boat or a pair of strong arms could participate. The surviving toll books appeared to support this account: they recorded thousands of journeys and hundreds of traders, suggesting a society defined more by activity than by inherited status.

[2] When the historian Clara Vale examined the same books, however, she noticed how narrowly they defined participation. The name beside a payment was usually that of a registered boat owner, although the work involved a much larger household. An owner's wife might negotiate a delivery; a daughter might maintain the accounts. Neither activity necessarily produced a separate entry. Earlier researchers had treated the public identity of a business as a transparent description of everyone who made it operate.

[3] Vale began interviewing older residents whose families had worked on the canal. Several remembered women arranging contracts and settling disputes. These recollections complicated the catalogue's account, but they did not automatically establish a better one. Interviews recorded decades after an event can absorb family pride, later expectations and the desire to tell a coherent story. Vale therefore rejected the suggestion that oral testimony should simply replace the written archive. Different kinds of evidence could conceal different things.

[4] An invoice found among a laundry business's papers offered a more specific connection. It listed payments made to a woman whose husband's name appeared in the toll register. A second document, carrying her signature, recorded her agreement to a delivery schedule. Neither document proved that women enjoyed equal authority throughout the canal economy. Together, however, they challenged the assumption that the absence of women's names from one official record demonstrated their absence from commercial decisions.

[5] The museum eventually revised its catalogue. Its new account did not replace an uncomplicated story of opportunity with an equally uncomplicated story of exclusion. Instead, it asked which activities the toll books had been designed to record, which relationships they left outside their categories, and how those limits shaped later interpretation. The books remained valuable precisely because their silences could be investigated rather than filled with whatever a reader wished to find.

[6] Vale's conclusion was deliberately modest. Historical research cannot recover every conversation or distribute recognition with perfect accuracy. But it can distinguish between saying that an activity has not been documented and saying that it never occurred. A silence in an archive is not an event that explains itself. Before treating it as evidence of social absence, a researcher must ask how it was produced.

36. Which title best captures the central concern of the passage?

A. What the Records Leave Out

B. The Decline of Canal Transport

C. Why Written Evidence Must Be Abandoned

D. A Museum That Rejected Commercial History

37. According to the passage, earlier researchers were most likely to assume that

A. oral accounts were always more reliable than invoices.

B. household members performed identical kinds of work.

C. the canal economy excluded all forms of inherited status.

D. the registered public identity of a business adequately represented those who operated it.

38. Which finding would most directly weaken the claim that women had no authority over canal contracts?

A. A photograph of women watching boats leave the town.

B. A verified agreement in which a woman independently settled the terms of a delivery.

C. An increase in the total number of journeys entered in a toll book.

D. A family story that an unnamed woman disliked the waterway.

39. The sentence “A silence in an archive is not an event that explains itself” suggests that

A. all missing records were deliberately destroyed.

B. historians should avoid conclusions based on any incomplete evidence.

C. the absence of an entry requires investigation before it is treated as the absence of an activity.

D. official documents reveal less than every personal memory does.

40. How does the author present Vale's approach to oral testimony?

A. As a complete replacement for official records.

B. As useful but fallible evidence to be considered alongside other sources.

C. As a means of proving that equal authority existed everywhere.

D. As inherently deceptive because it was recorded late.

Passage B

Original passage · organisational analysis

[1] A fictional design company wanted to understand why some employees rarely spoke during meetings. Its first response was to measure participation. For six weeks, a dashboard counted how often each person contributed and displayed the distribution within each team. Managers initially used the figures to identify meetings in which two or three people dominated the conversation. In that limited role, the dashboard made a familiar problem difficult to ignore.

[2] Trouble began when the company announced a numerical target for every employee. A contribution was defined as any uninterrupted speaking turn lasting more than a few seconds. Some workers split a single observation into several turns; others repeated points that had already been accepted. Quieter employees discovered that asking a minor question could be safer than challenging a major assumption. The number of contributions rose, while several meetings became longer and no easier to follow.

[3] The dashboard had not suddenly become inaccurate. It was counting speaking turns reasonably well. The difficulty was that the company had begun treating those turns as interchangeable units of influence. A brief objection that prevented an expensive mistake counted no more than a redundant summary. A thoughtful written response submitted after a meeting counted nothing. A measure that had begun as a diagnostic instrument had become a target, rewarding behaviour that satisfied the definition without necessarily serving the original purpose.

[4] After reviewing the pilot, the company kept the dashboard but removed the individual quotas. Teams received short documents in advance, so that the meeting did not reward only those who could formulate an immediate response. The role of chair rotated, and employees could submit concerns in writing. A facilitator also noted whether

objections received an answer, were postponed with a named owner, or simply disappeared from the discussion. These notes could not be reduced to one convenient score, but they made a distinction between being permitted to speak and being seriously heard.

[5] Not everyone welcomed the change. Some managers argued that qualitative notes made comparison less straightforward. Others worried that employees would describe every disagreement as evidence of poor leadership. The revised system therefore stated its criteria openly and allowed teams to question the facilitator's interpretation. Transparency did not remove judgement; it made judgement available for examination. The company accepted that a system designed to uncover complexity would sometimes make an apparently simple performance comparison harder.

[6] Three months later, meeting time had fallen in some teams and increased in others. The reviewers refused to call either change a success by itself. A shorter meeting could reflect better preparation, but it could also indicate that difficult objections had been suppressed. They instead examined decision records: Were disputed assumptions identified? Was responsibility for unresolved questions clear? Could an employee show what happened to a concern after raising it?

[7] The pilot did not demonstrate that counting is useless. It demonstrated that a useful count can become a misleading verdict when the link between the two is left unexplained. The strongest evidence of improvement was not that everyone spoke equally often. It was that disagreement had become harder to ignore and easier to follow through.

41. What was the central defect in using an individual speaking quota?

A. The software was unable to count speaking turns accurately.

B. It prevented employees from asking any questions.

C. It treated the frequency of speech as though it reliably measured meaningful influence.

D. It gave written responses more weight than spoken objections.

42. The examples in the second paragraph mainly illustrate

A. how people can adapt their behaviour to meet a metric without fulfilling its purpose.

B. why numerical targets always decrease the amount of speech.

C. that quieter workers lack the ability to identify important problems.

D. that repeating an accepted point necessarily improves a decision.

43. Which result would provide the strongest support for the revised system?

A. Every team held meetings of exactly the same length.

B. The dashboard showed an identical number of turns for all employees.

C. Managers no longer needed to exercise judgement.

D. Decision records showed that substantive objections were addressed and unresolved issues assigned to someone.

44. Which inference about the dashboard is best supported?

A. It should be discarded whenever a qualitative judgement is possible.

B. It can help reveal a problem, provided its limits and intended use remain clear.

C. It became more statistically accurate after the quotas were removed.

D. It can prove that all employees have equal influence.

45. Which strategy is NOT mentioned as part of the revised system?

A. Providing documents before meetings.

B. Rotating the person who chairs a meeting.

C. Paying bonuses according to the number of speaking turns.

D. Allowing employees to submit concerns in writing.

Passage C

Original passage · scientific explanation

[1] A museum demonstration uses a long, lightly stretched rope to show a distinction that is easy to miss: a wave can travel without carrying each part of the material along with it. A small motor moves one end of the rope up and down. A visitor watching from a distance sees a succession of crests moving towards the far end and may imagine that the rope itself is flowing in the same direction.

[2] A red ribbon tied to one point on the rope makes that interpretation difficult to maintain. As each crest passes, the ribbon moves mainly up and down around its original position. It does not follow the crest across the room. Neighbouring sections of rope pull on one another, passing the disturbance along. The travelling feature is therefore a pattern of displacement, while the material responds locally. Energy is transferred even though the marked point is not transported to the far end.

[3] The demonstration becomes more revealing when the motor is made to oscillate twice as often. Provided the rope and its tension remain unchanged and the motions are small, the wave speed stays approximately the same. The crests are now closer together: more complete oscillations must fit into the distance covered in one second. Frequency describes how often a point oscillates; wavelength describes the distance between successive crests. Neither quantity, considered alone, tells a visitor the speed at which the disturbance travels.

[4] To expose a common confusion, the museum places a light sensor beside the rope. A lamp flashes whenever a crest passes the sensor. Increasing the motor's frequency makes the lamp flash more often, which some visitors take as proof that the wave is moving faster. Yet the lamp counts arrivals at one place; it does not measure the time needed to cover a known distance. A second sensor, one metre farther along the rope, allows the demonstrator to compare the arrival times of the same crest. That delay provides a way to estimate speed.

[5] At the far end, a soft absorbing attachment reduces the disturbance that returns towards the motor. Without sufficient absorption, a returning wave can overlap the outgoing one and make the simple moving pattern harder to identify. For the speed measurement, the demonstrator uses an isolated pulse and records its first arrival at each sensor, before a reflection can return. The equipment is elementary, but the sequence matters: observe a marked piece of material, change one condition, and then choose a measurement that answers the actual question. Counting more events is not the same as finding that each event travels faster.

46. What does the red ribbon chiefly demonstrate?

A. Every part of the rope is transported to the far end.

B. The rope remains perfectly motionless while a wave passes.

C. The motor creates a new piece of rope for each crest.

D. A travelling disturbance can pass while a marked part of the material remains near its original position.

47. If the frequency is doubled under the conditions specified in the passage, the wavelength will be approximately

A. twice as long.

B. unchanged.

C. half as long.

D. four times as long.

48. Why is a single flashing lamp insufficient to establish that the wave has become faster?

A. It records how often crests arrive, rather than the travel time over a known distance.

B. It changes the tension in the rope every time it flashes.

C. It can detect only waves that carry material across the room.

D. It prevents any crest from reaching the second sensor.

49. For the two-sensor speed estimate, which procedure is most consistent with the passage?

A. Comparing any two flashes without checking which crest caused them.

B. Timing the first arrival of the same isolated pulse at the two sensors.

C. Measuring how far the red ribbon travels towards the end of the room.

D. Waiting until reflected waves make the pattern difficult to identify.

50. Which detail cannot be determined from the passage?

A. The approximate separation of the two sensors.

B. The principal direction in which the red ribbon moves.

C. The exact material from which the rope is made.

D. The purpose of the absorbing attachment.
